After procedure, where is the patient going?

Transport the intubated patient. Ensure that the HME filter is connected to the ETT.

Anesthesiologist transporting patient wears gown, gloves, N95, face shield.

One transport person will interact with the environment (push buttons, open doors), but will not provide direct patient care. This person should be in appropriate PPE. Consider bringing germicidal wipes to clean areas of accidental contamination along the way.

For extubation, transfer patient to a negative pressure room (500P: OR 34, PACU Pt Bay 61. 300P: Room next to front desk). Extubate and recover in the same room.

For transport back to ward floor, place non-rebreather oxygen mask and then a surgical mask over that. Do not transport the patient out of the OR to their isolation room until coughing or the need for suctioning have subsided.

Consider transport monitor for O2 saturation.
